[TP] The molar mass of Cl is 35.453 g.  $^{37}\text{Cl}$  has a natural abundance of 24.24%. Which of the following statements is true?

75% 1. The mass of one atom of naturally occurring Cl is 35.453 g divided by Avogadro's number

17% 2. The mass of one atom of naturally occurring Cl **cannot be** 35.453 g divided by Avogadro's number.

8% 3. Neither of the statements is true.

SESSION ID

12 of 15

BOSTON UNIVERSITY

1

Lecture 2 CH131 Summer 1 2021  
Tuesday, May 25, 2021

- Quizzes and final exam using Gradescope
- Atomic weight
- Chemist's dozen: The mole
- Example problems: Chemical formulas, equations, and reaction yields
- Limiting reagent recipe

Begin ch3: Chemical bonding: The classical description

- Ionization energy:  $X(g) \rightarrow X^+(g) + e^-$

Next lecture: Anatomy of electron clouds;  $IE_1 \rightarrow$  electron cloud expansion; Electron affinity:  $X^-(g) \rightarrow X(g) + e^-$ ; Electronegativity:  $EN \sim IE_1 + EA$ ; Dipole moment and ionic character:  $\sim \Delta EN$

### Quizzes and final exam using Gradescope

Show your work for each question in the space provided in the question. You may do this in one of two ways:

(1) download this document, write your work on it, and then scan the completed document as a PDF, or

(2) do your work directly on the PDF of this document using a tablet device.

When you have finished, submit your PDF to Gradescope following the instructions on the handouts page.

If do not have a tablet device or printer, please email me at [dan@bu.edu](mailto:dan@bu.edu).

I'll provide a practice quiz shortly.

### Atomic weight = magnitude of average mass

The atomic weight of K is 39.098 (no units!)

The atomic weight of Br is 79.904

The atomic weight of H is 1.008

The atomic weight of an element is the number given on the periodic table.

BOSTON UNIVERSITY

[TP] The molar mass of Cl is 35.453 g. <sup>37</sup>Cl has a natural abundance of 24.24%. Which of the following statements is true?

- 0% 1. The mass of one atom of naturally occurring Cl is 35.453 g divided by Avogadro's number
- 77% 2. The mass of one atom of naturally occurring Cl cannot be 35.453 g divided by Avogadro's number.
- 23% 3. Neither of the statements is true.

Handwritten notes:

atomic weight  $\left. \begin{matrix} aX = 10, 50\% \\ bX = 20, 50\% \end{matrix} \right\}$

### Terms to distinguish

**Relative atomic mass,  $A_r$ :** ratio of mass of an isotope relative to mass of 1/12 of one <sup>12</sup>C atom  
 $A_r$  of <sup>13</sup>C is 13.00335 (unitless)

**Atomic mass unit,  $u$ :** 1/12 mass of one <sup>12</sup>C atom  
 $1 u = (1/12) \times (12 g / N_A) = g / N_A = 1.66054 \times 10^{-24} g //$

**Atomic weight:** average of relative atomic masses of an element  
 Atomic weight of C is 12.01 (unitless)

**Molar mass,  $M$ :** Mass in grams numerically equal to atomic weight; that is, the mass in grams of  $N_A$  "average atoms" of an element  
 Molar mass of C is 12.01 g

Handwritten notes:

<sup>12</sup>C <sup>13</sup>C <sup>14</sup>C

### Mole: Count by weighing

The mass in g of 1 mol of any element is called its **molar mass**

Number of particles in 1 mol is  $N_A = 6.02214076 \times 10^{23}$

Each of these amounts contains the **same number** of atoms

Handwritten notes:

Si 28.086  
 28.086 g of Si contains  $N_A = 6 \times 10^{23}$  atoms of Si.

Cu 63.546  
 63.546 g =  $N_A$  of "average" Cu atoms

[TP] Which contains the **most molecules**?

- 0% 1. 1 g of H<sub>2</sub>
- 0% 2. 45 g of Cl<sub>2</sub>
- 0% 3. 28 g of N<sub>2</sub>
- 100% 4. 24 g of CH<sub>4</sub>
- 0% 5. Not sure

Handwritten calculations:

convert of mole

H<sub>2</sub>:  $1 g \times \frac{1 mol}{2 g} = 0.5 mol$

Cl<sub>2</sub>:  $45 g \times \frac{1 mol}{70 g} = 0.64 mol$

N<sub>2</sub>:  $28 g \times \frac{1 mol}{28 g} = 1 mol$

CH<sub>4</sub>:  $24 g \times \frac{1 mol}{16 g} = 1.5 mol$

CH<sub>2</sub>:  $45 g \times \frac{1 mol}{70 g} = \frac{3}{2} mol$

### Mass to molecules

Which contains the most molecules?

1 g of H<sub>2</sub>:  $1 \text{ g} \times \frac{\text{mol}}{2 \text{ g}} = 0.5 \text{ mol}$

45 g of Cl<sub>2</sub>:  $45 \text{ g} \times \frac{\text{mol}}{(2 \times 35) \text{ g}} = 0.64 \text{ mol}$

28 g of N<sub>2</sub>:  $28 \text{ g} \times \frac{\text{mol}}{(2 \times 14) \text{ g}} = 1.0 \text{ mol}$

24 g of CH<sub>4</sub>:  $24 \text{ g} \times \frac{\text{mol}}{(12 + 4 \times 1) \text{ g}} = 1.5 \text{ mol}$

[TP] Which of the following contains the least number of atoms?

8% 1. 187 g of liquid mercury, Hg

92% 2. 1400 u of uranium, U

0% 3.  $6 \times 10^{24}$  atoms of sodium, Na

0% 4. 2 mol of hydrogen gas, H<sub>2</sub> = 4 moles of H

0% 5. Not sure

Handwritten notes: (12) of C, how many atoms - just 1.

Handwritten calculations:

$$187 \text{ g} \times \frac{1 \text{ mol}}{201} \times N_A \approx 0.9 \times 6 \times 10^{23} \text{ atoms}$$

$$1400 \text{ u} \times \frac{1 \text{ atom}}{238 \text{ u}} \approx 7 \text{ atoms}$$

Handwritten boxes for Hg (201) and U (238).

Problem: 7e 2.7; 8e 1.31

Handwritten notes: A<sub>2</sub> 49 atoms, A 51 atoms

7. The vitamin A molecule has the formula C<sub>20</sub>H<sub>30</sub>O, and a molecule of vitamin A<sub>2</sub> has the formula C<sub>28</sub>H<sub>44</sub>O. Determine how many moles of vitamin A<sub>2</sub> contain the same number of atoms as 1,000 mol vitamin A.

Handwritten calculations:

|      |      |
|------|------|
| 7e   | 8e   |
| 2.7  | 1.31 |
| 2.33 | 2.21 |
| 2.35 | 2.73 |
| 2.39 | 2.27 |
| 2.47 | 2.35 |
| 2.49 | 2.37 |

$$\# \text{ of atoms in A} = 1,000 \text{ mol A} \times \frac{51 \text{ atoms}}{1 \text{ mol A}} \times \frac{N_A}{N_A}$$

$$= 1,000 \times 51 \times N_A$$

$$\# \text{ of atoms in A}_2 = x \text{ mol A}_2 \times \frac{49 \text{ atoms}}{1 \text{ mol A}_2} \times \frac{N_A}{N_A}$$

$$= x \times 49 \times N_A$$

$$\# \text{ atoms in A} = \# \text{ atoms in A}_2$$

$$1,000 \times 51 \times N_A = x \times 49 \times N_A$$

$$x = \frac{51}{49} \approx 1.04$$

**Problem: 7e 2.47, 8e 2.35**

$NH_3 + HCl \rightarrow NH_4Cl$

47. When ammonia is mixed with hydrogen chloride (HCl), the white solid ammonium chloride ( $NH_4Cl$ ) is produced. Suppose 10.0 g ammonia is mixed with the same mass of hydrogen chloride. What substances will be present after the reaction has gone to completion, and what will their masses be?

$10.0g \times \frac{1 mol}{(14+3)g} = 0.587 mol NH_3$   
 $10.0g \times \frac{1 mol}{(1+35)g} = 0.274 mol HCl$

|   |            |           |          |
|---|------------|-----------|----------|
|   | $NH_3/mol$ | $HCl/mol$ | $NH_4Cl$ |
| I | 0.587      | 0.274     | 0        |
| C | -0.274     | -0.274    | +0.274   |
| F | 0.313      | 0         | 0.274    |

ICF table  
 $Cl = 0.587 mol HCl$   
 $0.313 mol NH_3 \times (14+3)g = 5.33g$   
 $0.274 mol NH_4Cl \times (14+4+35)g = 14.7g$   
 $= 0.274 mol NH_4Cl$   
 HCl is the limiting reagent
